

Microbizz

✓ Available in DK

 Client integration - VoIPcube client mandatory

Introduction

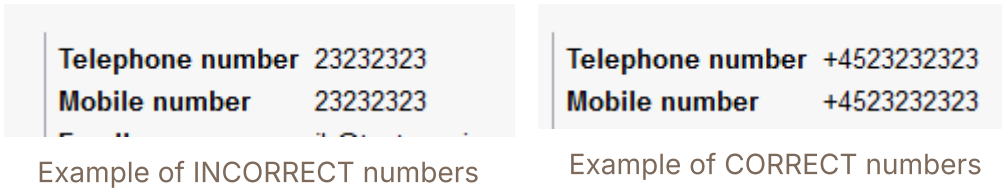

Users receive a popup containing basic information about the contact hit and gives the option to open the person page in the Microbizz website.

Popup example

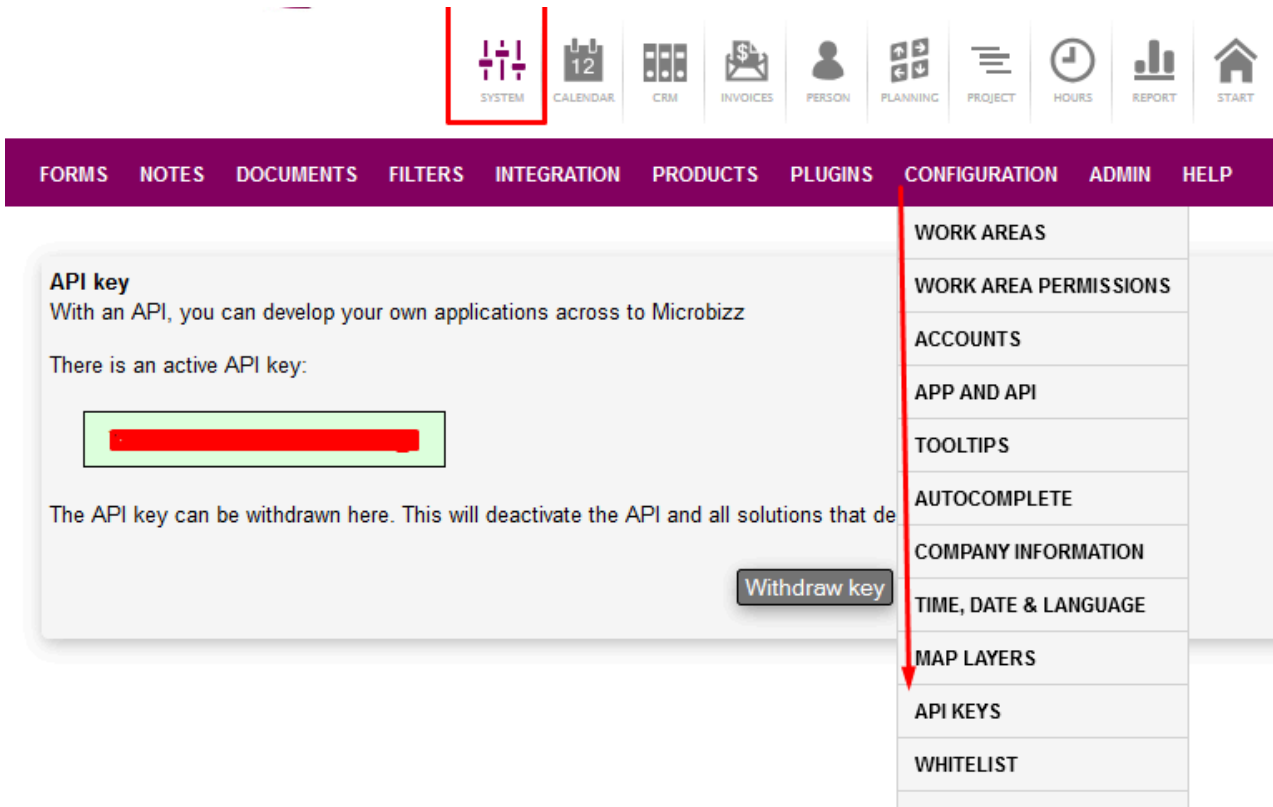

Usage

The contact search is based on the fields mobile and phone number of the person. These need to be stored WITH a leading +45 in order to work. Without the leading +45 the contact will NOT be found.

Configuration

An API key is needed for the integration to work. Log in as an administrator, go to SYSTEM > CONFIGURATION > API KEYS and note down the value. If there is no API key one needs to be generated.

Assignment

When assigning the integration to a customer it will prompt for a few fields.

- ApiKey

This is where the API key from the previous section should be filled in.
